Notes

Note on Crude Versus Age-Adjusted Mortality Rates

The Needs Assessment Technical Report presents both the crude and age-adjusted death rates (AADR). Crude rates are merely the actual number of deaths for a given cause for a desired population divided by total number in the desired population and then multiplied by 100,000 to get the rate per 100,000 population, while AADR represent crude rates adjusted to standardize the population distribution effects on the rate.

Although useful for certain purposes, the crude death rate as a comparative measure has a major shortcoming: it is a function of the age distribution of the population at risk. For example, the population at risk in one county may be primarily elderly persons ages 65 and older while the population at risk in another county may be primarily of persons ages 40 to 50. Crude rates are recommended when a summary measure is needed and it is not necessary or desirable to adjust for other factors.

The frequency with which health events occur is almost always related to age. In fact, the relationship of age to risk often dwarfs other important risk factors. For example, acute respiratory infections are more common in children of school age because of their immunologic susceptibility and exposure to other children in schools. Chronic conditions, such as arthritis and atherosclerosis, occur more frequently in older adults because of a variety of physiologic consequences of aging. Mortality rates tend to increase after the age of 40.

Because the occurrence of many health conditions is related to age, the most common adjustment for public health data is age adjustment. The age-adjustment process removes differences in the age composition of two or more populations to allow comparisons between these populations independent of their age structure.

The age-adjusted death rate is a summary measure that eliminates the effect of the underlying age distribution of the population. The result is a figure that represents the theoretical risk of mortality for a population, if the population had an age distribution identical to that of a standard population. For example, a county's age-adjusted death rate is the weighted average of the age-specific death rates observed in that county, with the weights derived from the age distribution in an external population standard, such as the U.S. population.

Age-adjustment then allows for the comparison of two distinct populations (for example, Columbia County versus Florida) which most likely have differing age distributions. The age effects are in essence removed from the rates and the age-adjusted death rate then no longer reflects the actual death rate but is an indicator rate that can be used for relative comparisons.

In the past, the National Center for Health Statistics (NCHS) age-adjusted rates using the US 1940 standard population. Other agencies used the US 1970 Standard. Beginning with 1999 data, federal agencies began age-adjusting to the US 2000 Standard Million Population.

Note on Zip Codes

For tables with zip codes listed, the post office box zip codes are included with the main zip codes. To provide the most accurate data summary for the county, for each data element presented by zip code, the total sum of the zip code data is presented as well as the overall county totals. Post office zip code 32056 Lake City is included with 32055(Lake City).

When data is presented by zip codes for deaths and births, a five year rate is calculated due to the small numbers by zip code. Some Hispanic data was not available by zip code or else the numbers were too small to separate out.

All data are presented at the county level and state level for each indicator. Zip Code level data are presented where available.

Note on Death Data

The various causes of death that are presented in this report are included in the following table along with the ICD 10 Codes that identify them.

Cause of Death	ICD 10 Codes
All Causes	All Codes
Alzheimer's Disease	G30
Cancer	C00-C97
Chronic Liver Disease & Cirrhosis (Liver Disease)	K70, K73-K74
Chronic Lower Respiratory Disease (CLRD)	J40-J47
Congenital & Chromosomal Anomalies	Q00-Q99
Diabetes	E10-E14
Essential Hypertension & Hypertensive Renal Disease (Hypertension)	I10, I12
Heart Disease	I00-I09, I11, I13, I20-I51
HIV/AIDS (HIV)	B20-B24
Homicide	X85-Y09, Y87.0
Influenza & Pneumonia	J10-J18
Motor Vehicle Traffic Crashes (MV Crashes)	V02-V04, V09.0, V09.2, V12-V14, V19.0-V19.2, V19.4-V19.6, V20-V79, V80.3-V80.5, V81.0-V81.1, V82.0-V82.1, V83-V86, V87.0-V87.8, V88.0-V88.8, V89.0, V89.2
Nephritis, Nephrotic Syndrome & Nephrosis (Nephritis)	N00-N07, N17-N19, N25-N27
Parkinson's Disease	G20-G21
Perinatal Conditions	P00-P96
Septicemia	A40-A41
Stroke	I60-I69

¹ A margin of error (MOE) is the difference between an estimate and its upper or lower confidence bounds. Confidence bounds can be created by adding a margin of error to the estimate (for an upper bound) and subtracting the margin of error from the estimate (for a lower bound). All published margins of error for the Small Area Health Insurance Estimates program are based on a 90 percent confidence level.

² The number in a demographic group is the number of people in the poverty universe in that age, sex, and race/Hispanic origin group.
